

26 January 2017, Pullman London St Pancras, London, UK

Professor Kimme Hyrich, MD, PhD, FRCPC, UK

- Professor of Epidemiology, Centre for Musculoskeletal Research, University of Manchester, UK
- Honorary Rheumatology Consultant at Central Manchester Foundation Trust

ROUNDTABLE ON REGISTRIES

Practical Considerations for Registries – making them work

Practical experience with a pharmaco- vigilance register for biologicals/ biosimilars – the BSRBR-RA*, a Manchester case study

Professor Kimme Hyrich, MD, PhD, FRCPC, UK

26 January 2017

Practical experience with a pharmacovigilance register for biologicals/biosimilars

The BSRBR-RA, a Manchester case study

Professor Kimme Hyrich

The University of Manchester

MANCHESTER
1824

The University of Manchester

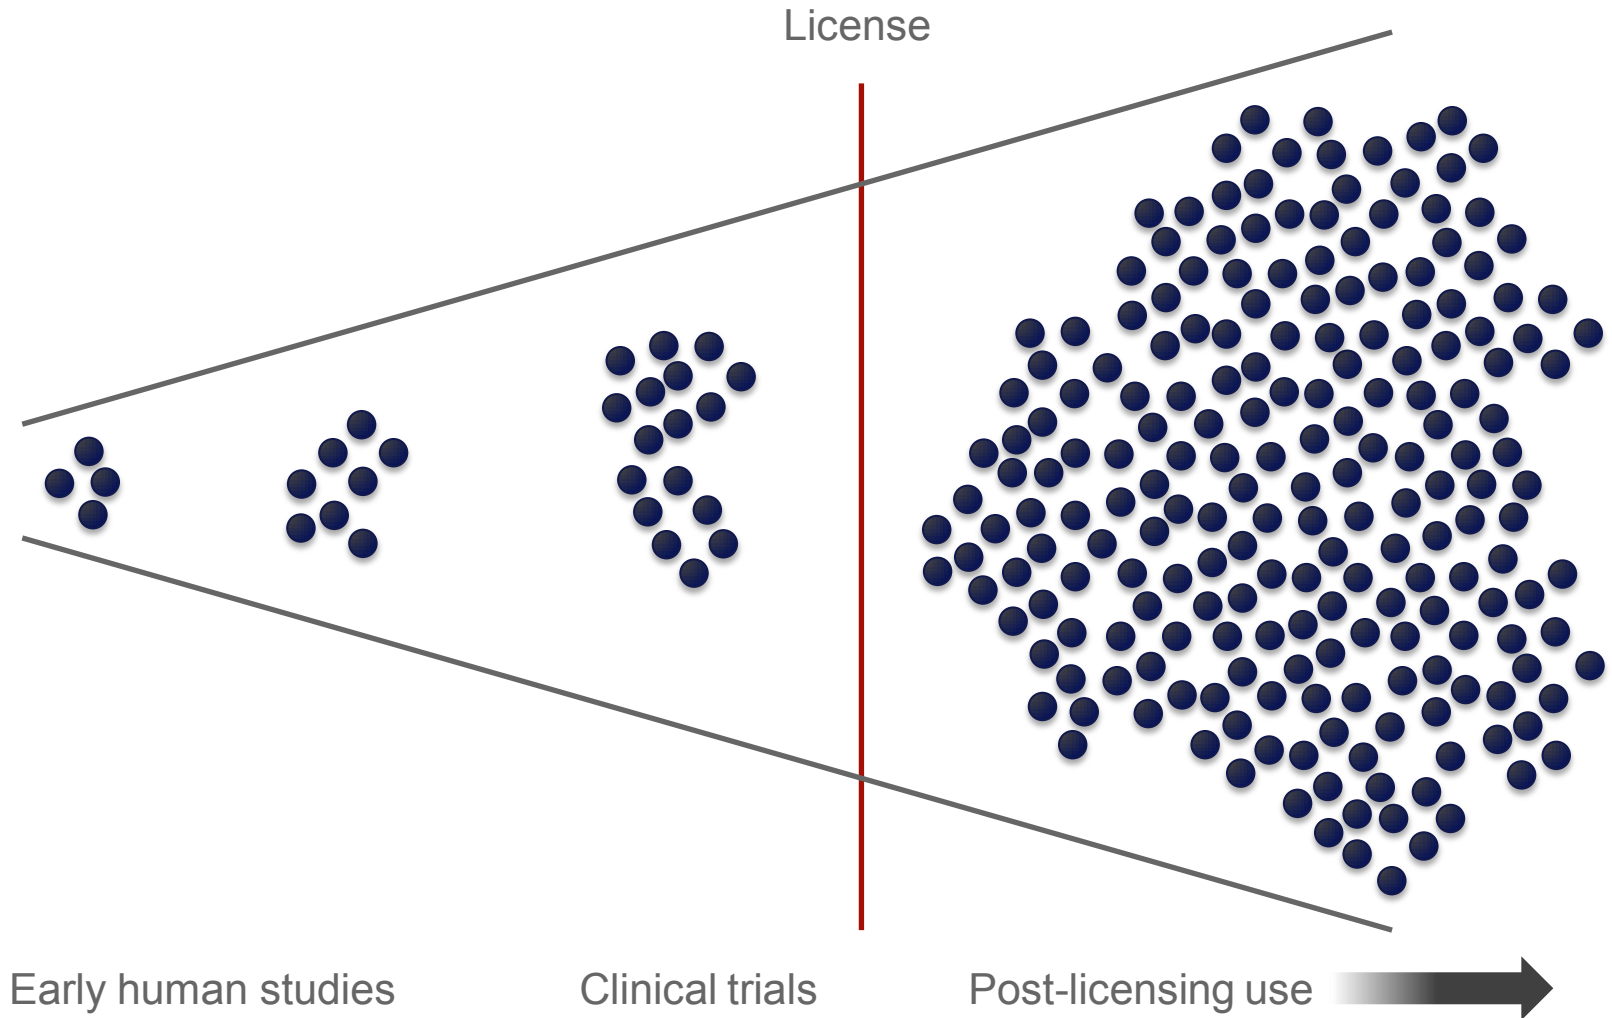

- Commenced 2001
- Observational prospective cohort study
- Initially a study of original anti-TNF therapies but has expanded to include rituximab, certolizumab, tocilizumab and most recently biosimilars

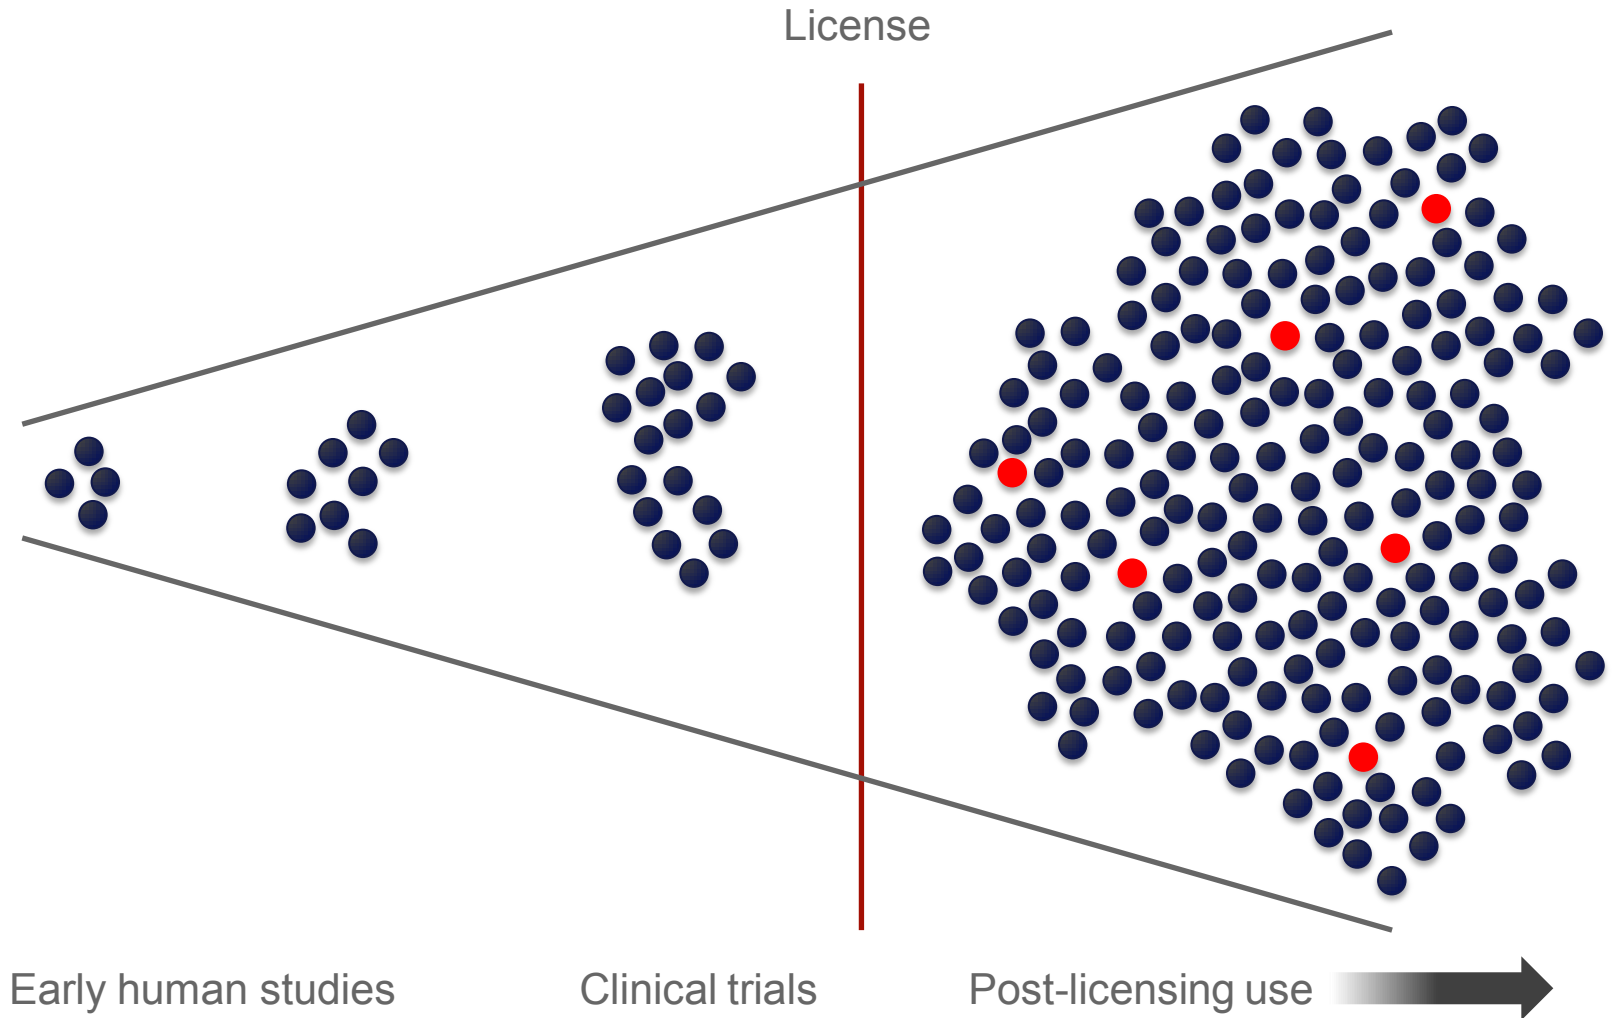

Exposure: From Bench to Bedside

Exposure: From Bench to Bedside

Spontaneous Pharmacovigilance

Observational Patient Registers

Clinical Trials vs. Observational Studies

Trials

Ideal, “designed” setting

Observational Studies

Real-world

Observational Patient Registers

Increased external validity

- Increased sample size
 - Wider variety of patients
 - Longer follow-up, even after drug is stopped
- But, treatment decisions no longer randomised.
 - Careful consideration must be taken if comparing outcomes between treatments.

BSR **BR**

The British Society for
Rheumatology
Biologics Registers

Rheumatoid Arthritis

A New Way of Conducting Drug Safety Research

- Context:
 - All pharma companies must continue to monitor the effectiveness and safety of their drugs after they are licensed.
 - The BSRBR represented a new way of adding to these data.
 - An independent academic institution would gather safety data independently to the pharma companies and share anonymous safety data with pharma as part of a risk management plan.

A New Way of Conducting Drug Safety Research

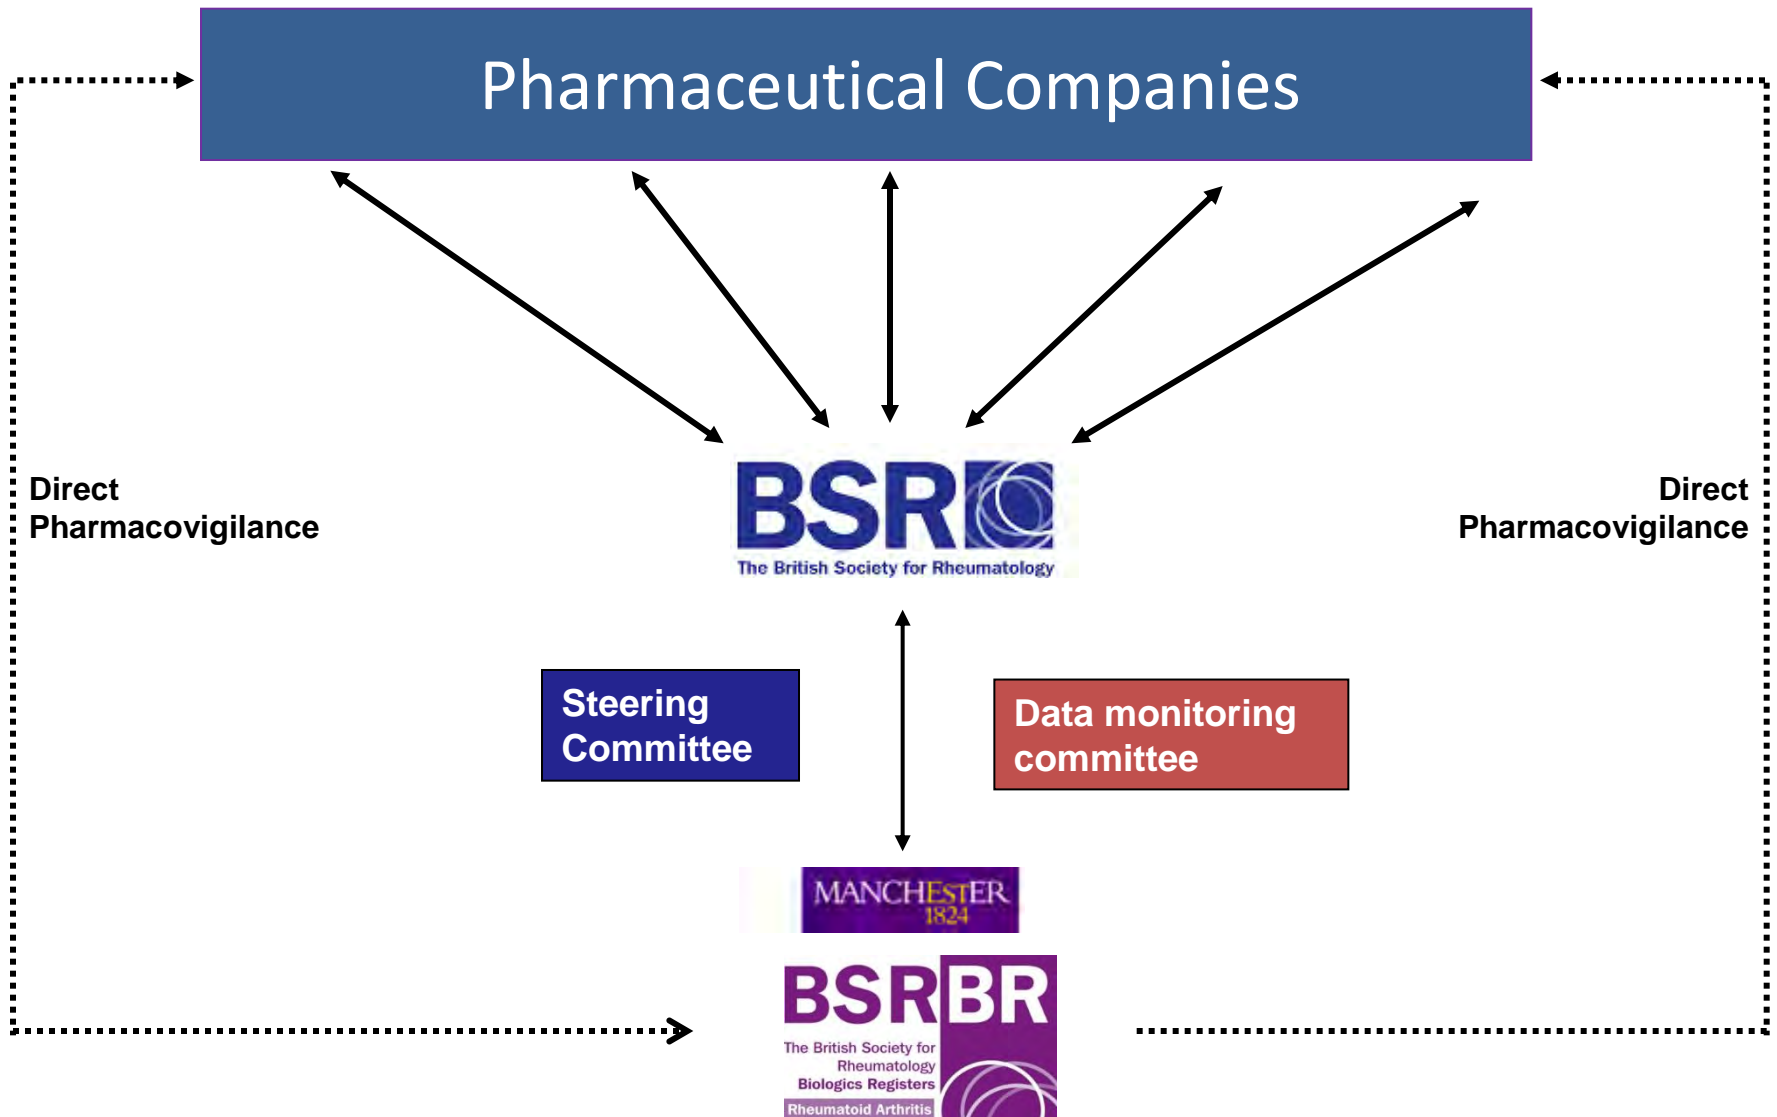

- **Pharmacoepidemiology:**

- The BSR would oversee the register. They would conduct negotiations with pharma and also allow academics to analyse the data independent of pharma to address questions about “real-world” safety and effectiveness.

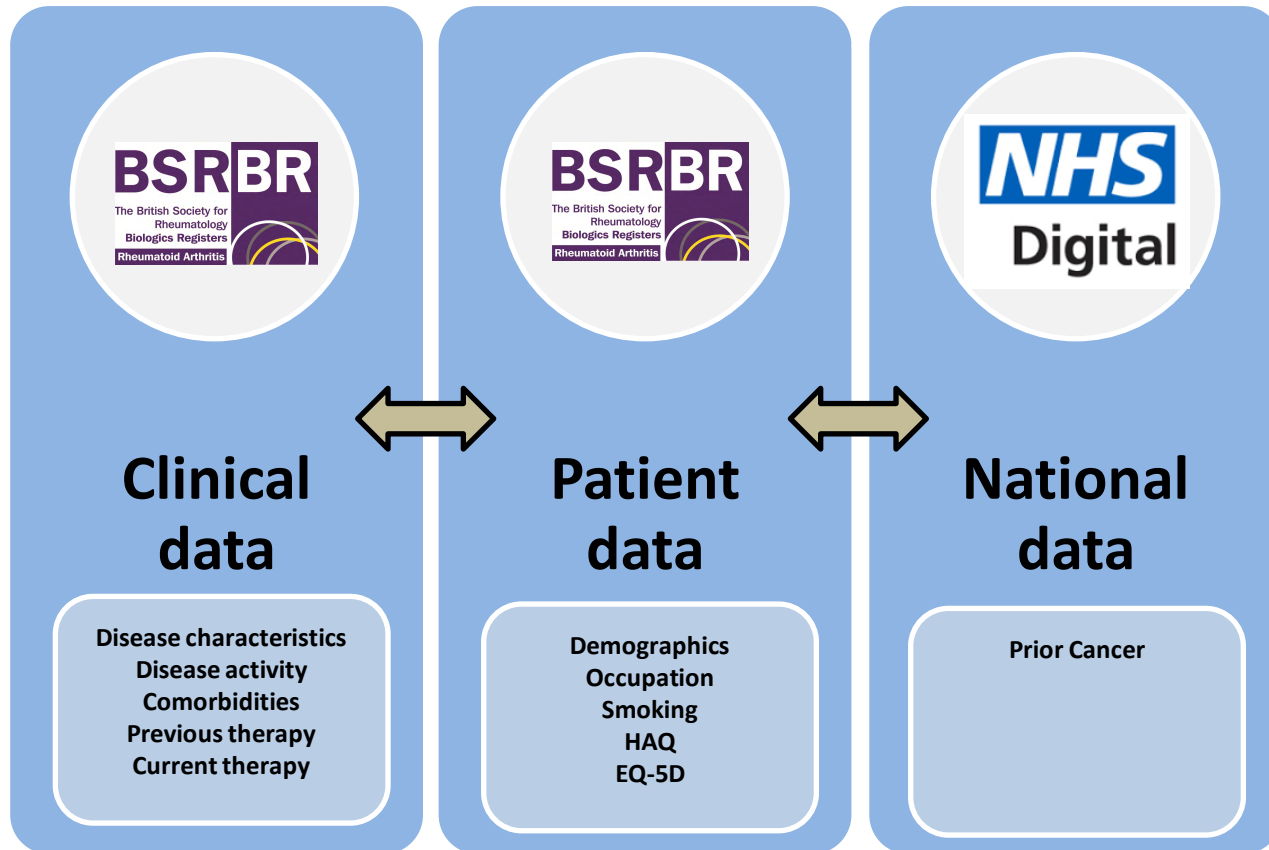

- **Pharmacovigilance:**

- The University would be required to report serious adverse events (SAEs) (with no patient or doctor identifiers) and 6-monthly aggregated reports to pharma to help them monitor the safety of their new products.

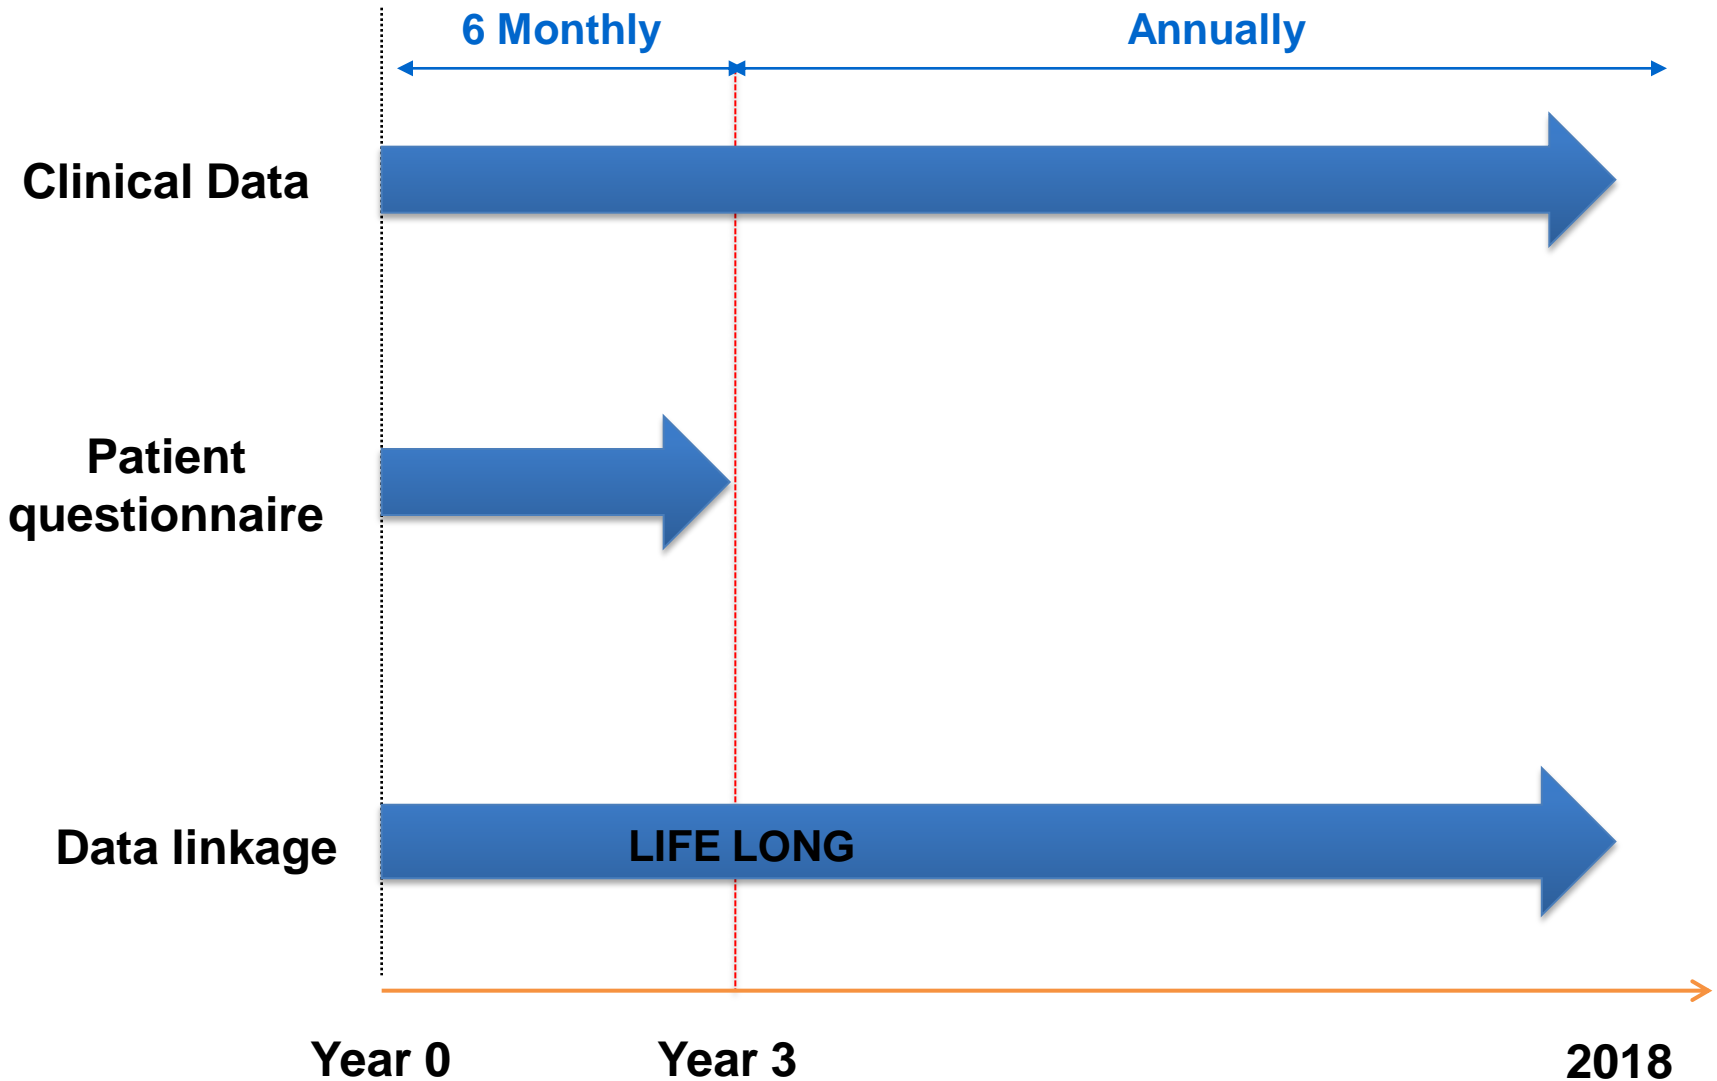

BSRBR-RA Funding and Stakeholders

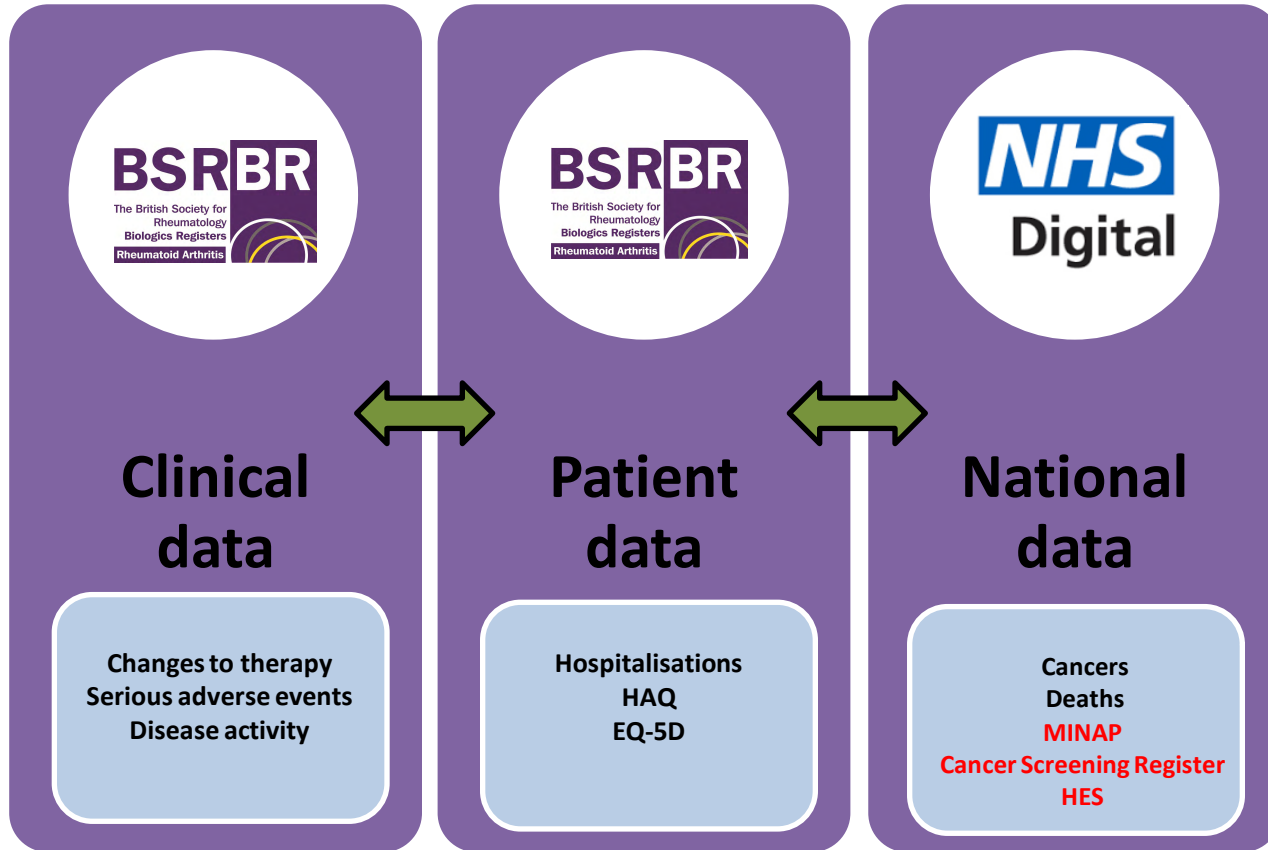

Baseline data collection (At start of biologic)

Follow-up

Follow-up data collection

Events of Special Interest Forms

MANCHESTER
The University of Manchester
BSRBR
The British Society for Rheumatology Biologics Register
Rheumatology Research Unit

**BSRBR-RA Event of Special Interest (ESI) Report
MI / ACUTE CORONARY SYNDROME**

Patient Name: _____ Date of Birth: _____
 PATIENT ID: _____ HRN: _____
 Biologic at time of event: _____ Date of Event: _____

Event Details (please annotate with any additional information)

Rise in cardiac markers? YES NO DONT KNOW
 (Highest level recorded)

Trop T / Trop I Level: _____

Did the patient have ischaemic symptoms? YES NO DONT KNOW

Did the patient have ischaemic changes YES NO DONT KNOW

ECG findings → Were there any ischaemic changes YES NO DONT KNOW
 → Were there any new Q waves YES NO DONT KNOW

Was the patient thrombolysed? YES NO DONT KNOW

Did they receive primary angioplasty on the same day as the event?
 YES NO DONT KNOW

Did they have any other cardiac intervention? YES NO DONT KNOW
 If yes, please specify what & when:

Form completed
 By: _____
 On: _____

Return to: BSRBR-RA, Arthritis Research UK Epidemiology Unit, The University of Manchester, Rutherford House, 40 Percroft Way, Manchester, M15 6SZ, or fax to 0161 275 1640.
 Thank you for your help!

**BSRBR-RA Event of Special Interest (ESI) Report
LYMPHOPROLIFERATIVE MALIGNANCY**

Patient Name: _____ Date of Birth: _____
 PATIENT ID: _____ HRN: _____
 Biologic at time of event: _____ Date of Event: _____

Event Details (please annotate with any additional information)

What was the diagnosis? (Please include site)

Histopathological classification & Staging/ Radiology: (If known, please enclose a copy of the results)

Treatment Regime:
 Withdrawal of MTX, no other treatment given
 Withdrawal of Anti TNF, no other treatment given
 Surgery Chemo regime Rituximab Radiotherapy

EBV Status: Positive Negative Unknown

History of Sjögren's disease? YES NO DONT KNOW

Provide name & hospital of doctor treating the malignancy if available:

Family history of cancer? YES NO DONT KNOW

Outcome? Resolved Not Resolved
 Resolved with sequelae Fatal

Had been submitted? YES NO UNKNOWN

Return to: BSRBR-RA, Arthritis Research UK Epidemiology Unit, The University of Manchester, Rutherford House, 40 Percroft Way, Manchester, M15 6SZ, or fax to 0161 275 1640.
 Thank you for your help!

**BSRBR-RA Event of Special Interest (ESI) Report
TUBERCULOSIS**

Patient Name: _____ Date of Birth: _____
 PATIENT ID: _____ HRN: _____
 Biologic at time of event: _____ Date of Event: _____

Event Details (please annotate with any additional information)

SITE OF INFECTION:

Diagnosis based on:
 Clinical signs and symptoms Chest X-Ray / CT Scan

PCR
 Did fast bacilli YES NO DONT KNOW
 If yes, please specify sample: _____
 Histology YES NO DONT KNOW
 If yes, please specify sample: _____

Is confirmed by CULTURE? YES / NO (please circle)
 Please specify sample: _____

Anti screening measures performed on patient:
 IFTs mm
 IFT (Quantiferon) Positive Indeterminate Negative
 → Did this indicate latent TB? YES NO

Relevant family history: _____
 No of years lived in UK: _____

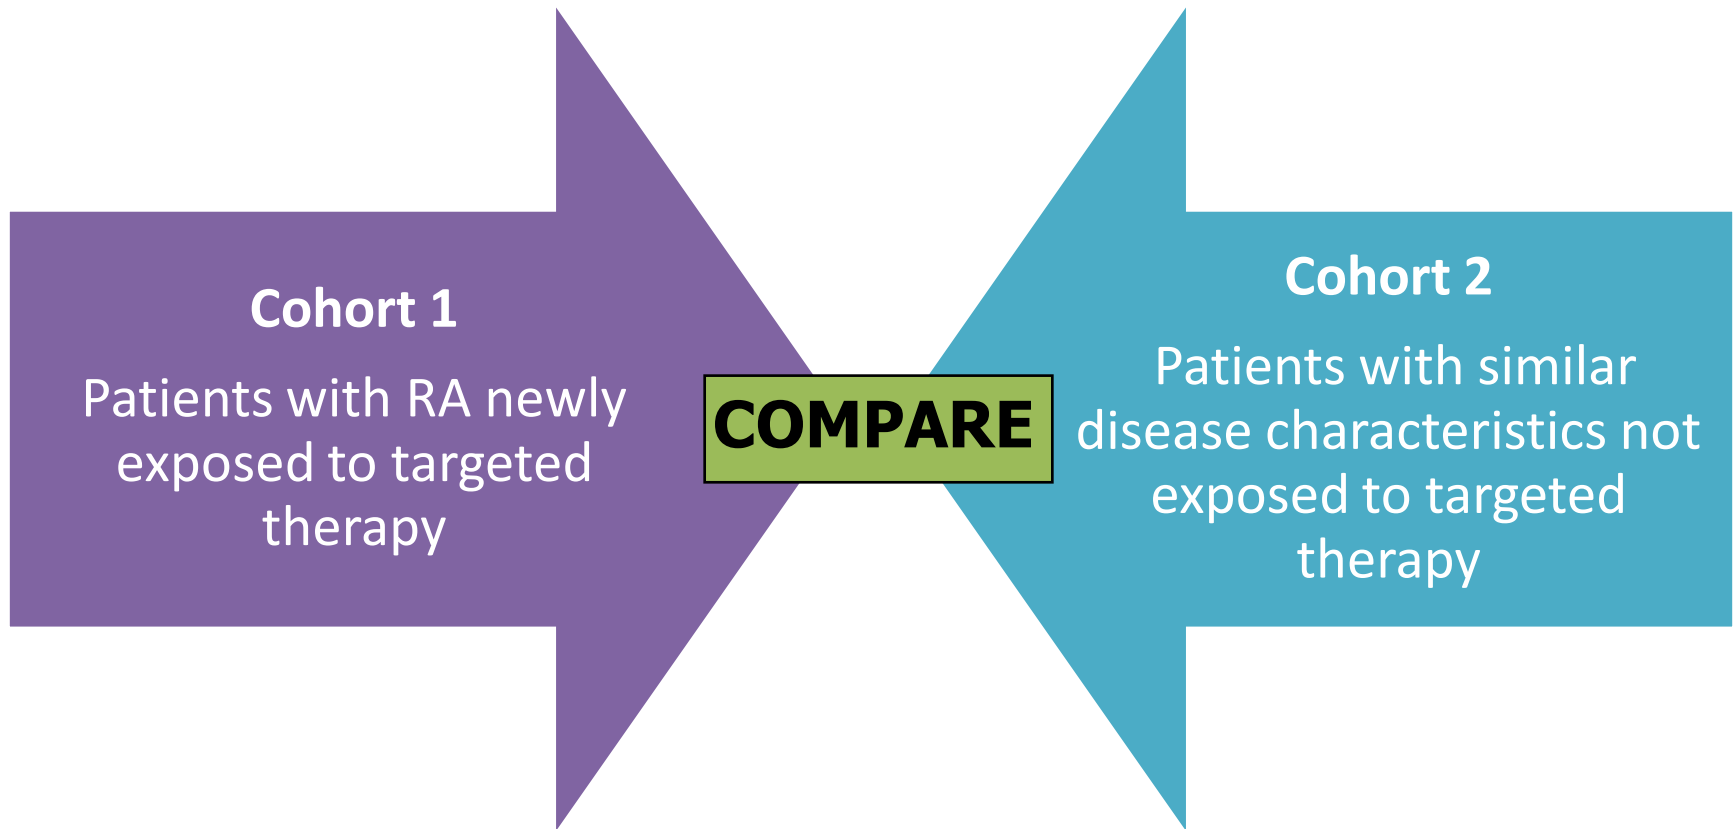

Latent TB prophylaxis? YES NO UNKNOWN
 Start date: _____ and end date: _____

Treatment:
 Latent active TB: _____

Submitted? YES NO DONT KNOW

Comparative Effectiveness Study Design

BSRBR-RA cohort recruitment/follow-up

BSRBR-RA cohort recruitment (to November 2016)

Cohort	Registrations	Ever Treated
Enbrel	6489	10651
Remicade	4909	6139
Humira	5396	9079
Mabthera	1651	5479
Cimzia	1306	1691
RoActemra	1225	2373
Biosimilars	379	432
Total Treatment Courses	21355	35844

How are the data collected?

Why are we so “old-fashioned”??

- **In an ideal world:** data captured in the medical record would automatically travel through to a national biologics register for analysis.
- **But:**
 - Study pre-dated widespread use of online data capture
 - Currently no universal rheumatology EMR
 - No national database of biologic prescribing
 - secondary care, injectables
- Currently, in the UK, no other way of capturing biologic exposure data or RA disease outcome data other than direct report

Example Biologics Registers In Europe

Country	Acronym	Year started
Switzerland	SCQM	1997
Finland	ROB-FIN	1999
Sweden	ARTIS	1999
Denmark	DANBIO	2000
Norway	NOR-DMARD	2000
Spain	BIOBADASER	2000
Germany	RABBIT	2001
United Kingdom	BSRBR-RA, BSRBR-AS	2001
Czech Republic	ATTRA	2002
Hungary	HU-REGAR	2003
Netherlands	DREAM	2003
France	RATIO,AIR, ORA and REGATE	2004
Russia	BIROSS	2005
Italy	GISEA	2008
Portugal	Reuma.pt	2008
Slovenia	BioRx.si	2008

Differences in European Registers

Traditional Cohort Model

Example:

UK, Germany, Czech Rep

Pros:

Extensive patient level data

Less missing data

Cons:

Hard work at local level

May require patient consent

Embedded in EMR

Example:

Sweden, Denmark, Swiss

Pros:

Potential for larger sample sizes

Patients must opt-out not opt-in

Cons:

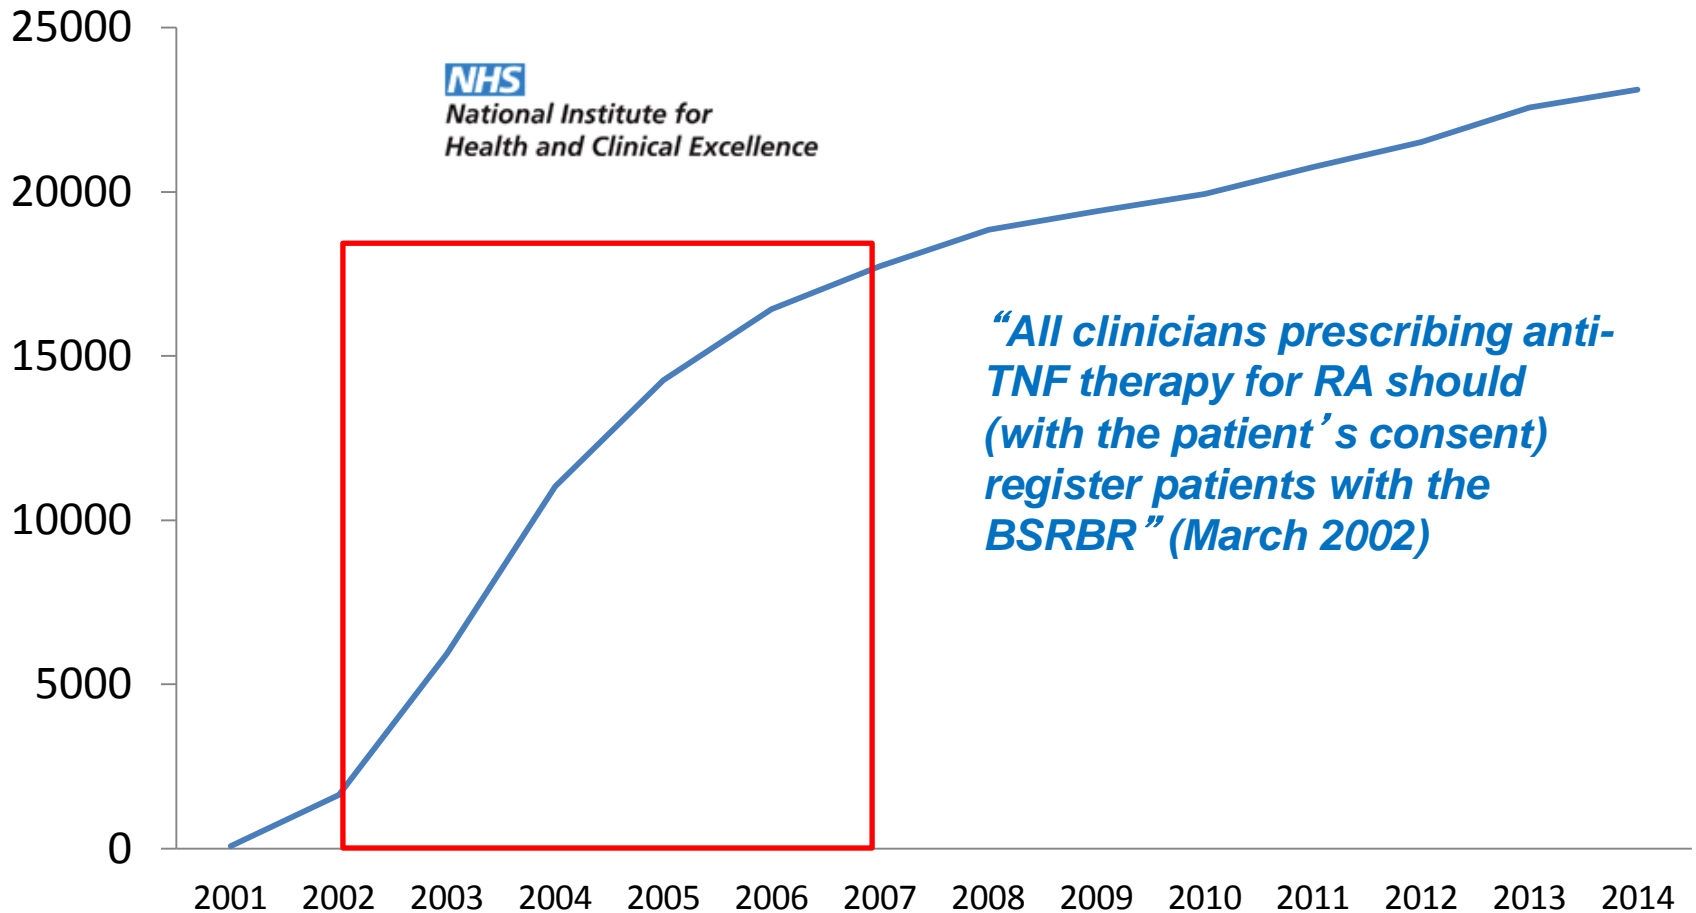

Risk of missing data

Less “event” details

2015

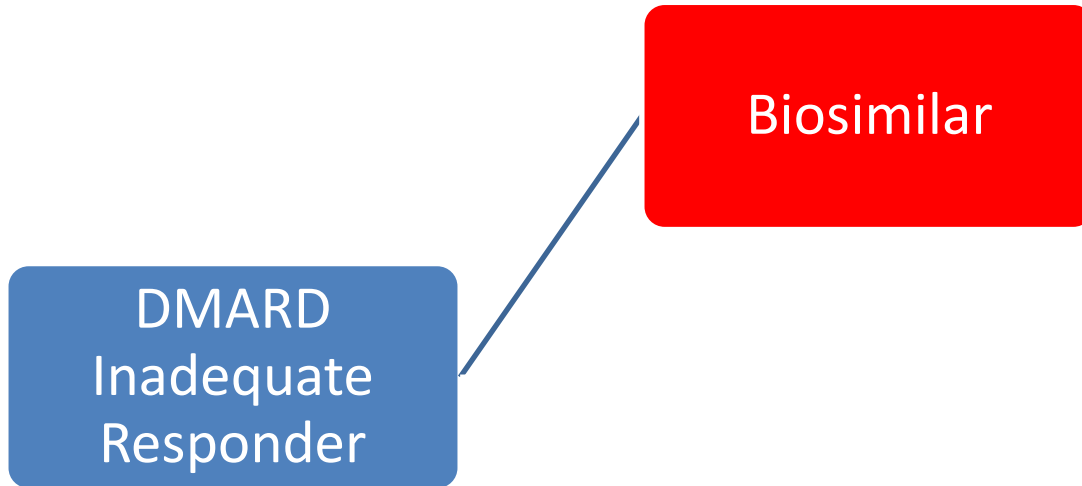

A new era for rheumatology with the launch of the first biosimilar product.

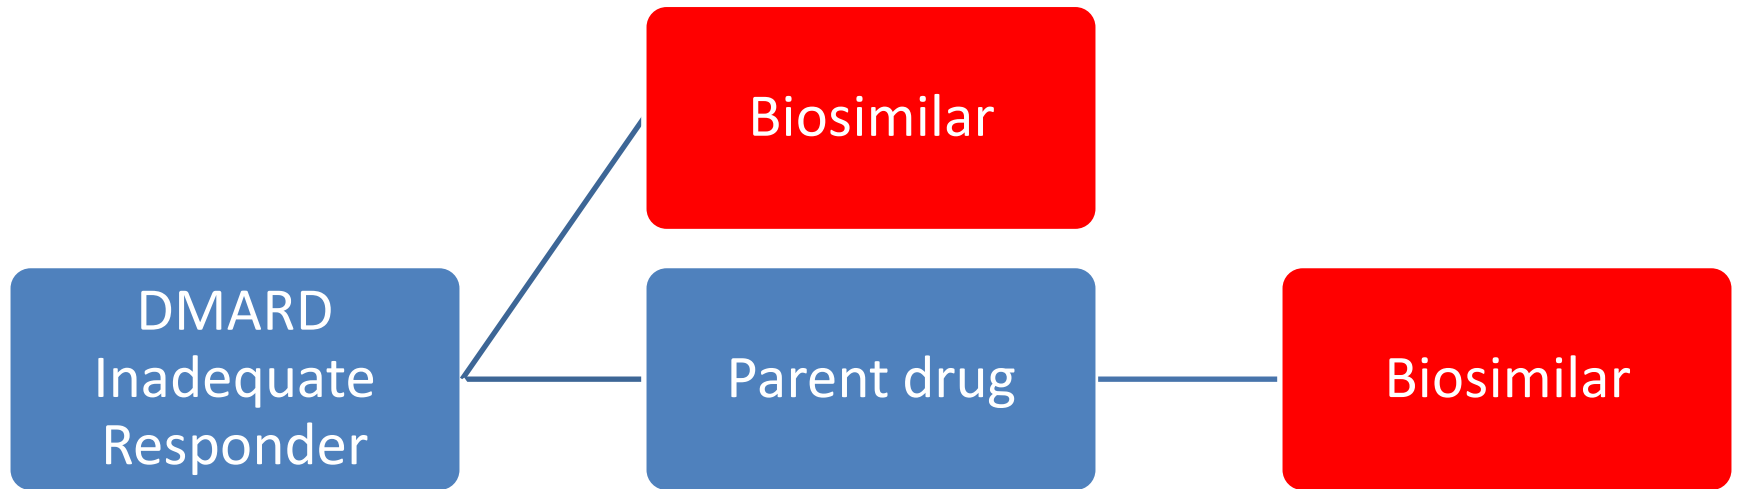

Biosimilars and the BSRBR-RA

DMARD
Inadequate
Responder

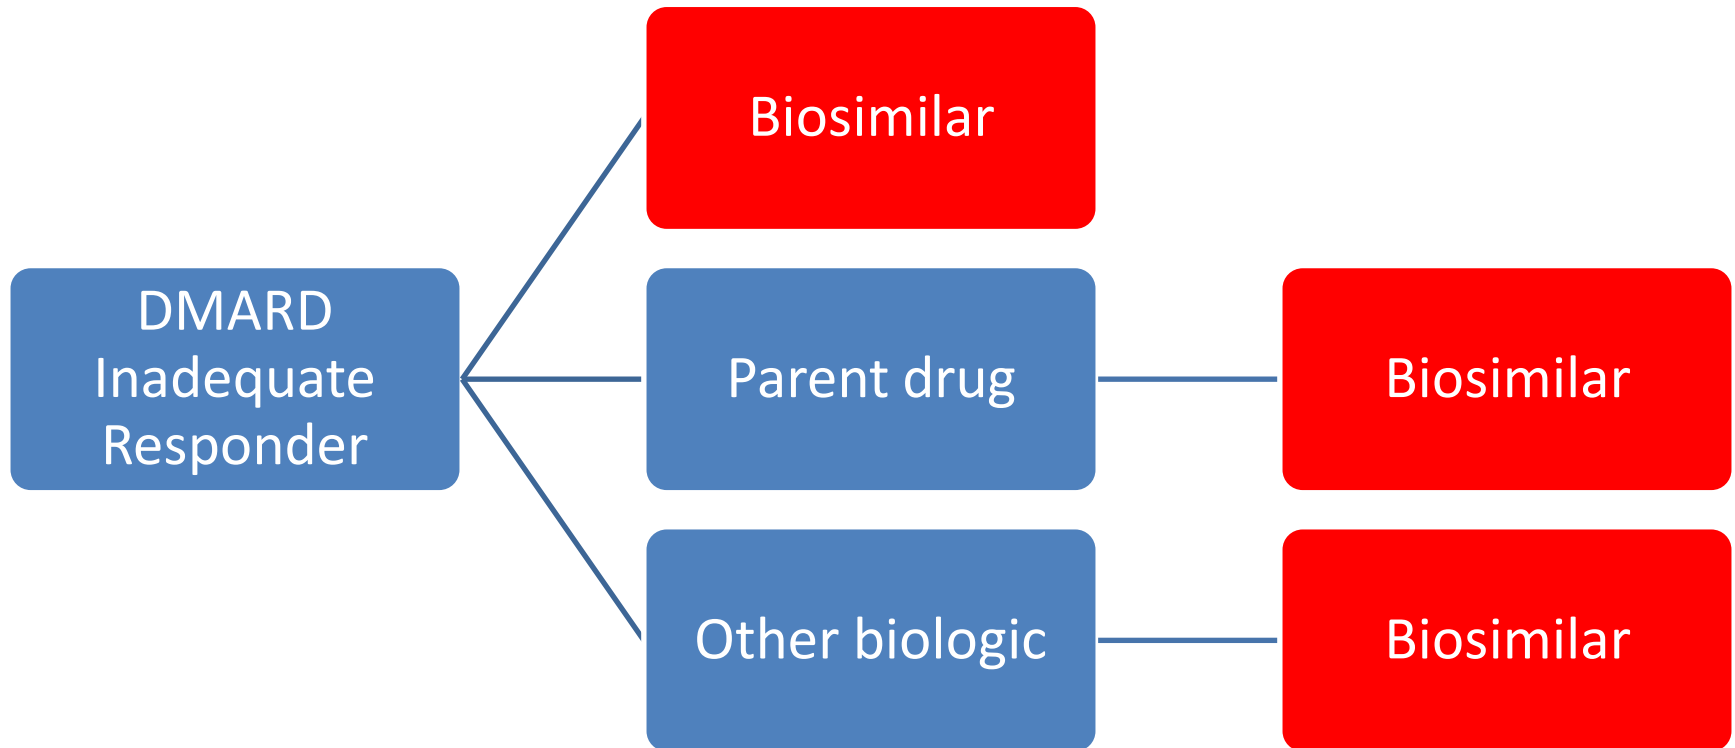

Biosimilars and the BSRBR-RA

Biosimilars and the BSRBR-RA

Biosimilars and the BSRBR-RA

Important to capture all exposures – regardless of point in pathway

Challenges in Capturing “Real-World” Biosimilar Exposure and Outcome Data

1. Expected number of treated patients in currently unknown

- May be small with increasing choice of therapies
- May be large if preferred treatment option

**Centres must be supported in identifying and
consenting patients and capturing data**

Challenges in Capturing “Real-World” Biosimilar Exposure and Outcome Data

2. Patients receiving biosimilars must be identifiable

- Need to capture drugs based on trade names not generic names
- Batch numbers on drug packaging will identify the drug.
- Drug packaging is available in hospital (infusion therapy) but may not be if drug home delivered
- **This is true not only for our study, but also for the treating clinical team**

Challenges in Capturing “Real-World” Biosimilar Exposure and Outcome Data

- 3. Exact date of “switch” must be available ideally with disease activity data captured at same time**
 - Will allow researchers to look at outcomes before and after change in therapy
 - But, exact date of switch may be unknown if drug is simply delivered to patient when current parent drug prescription nears its end

Challenges in Capturing “Real-World” Biosimilar Exposure and Outcome Data

- 4. Loss of effectiveness should be captured in addition to side effects**
 - Frequency of capture of disease activity scores in an observational register can make differentiation between primary and secondary “failure” difficult
 - May need to capture more frequent data
 - But, our experience now shows that DAS28 is not measured routinely at the point of switching, especially if switching is automatic or independent of the hospital.

Challenges in Capturing “Real-World” Biosimilar Exposure and Outcome Data

5. What is the appropriate comparison?

- Patients starting the parent drug?
- Same patient’s previous experience on parent drug?
- Will differ based on whether patients are starting a biosimilar de novo or switching from the parent drug

Summary

- Registers are a valuable source of “real-world” outcome data
- May be even more important for biosimilars given limited number of patients exposed at time of drug license
- Challenges in collecting and interpreting data
- Data collection must be supported
 - physicians, nurses, patients, trusts, drug companies, NHS
